Wi-Fi Product Watch

By [Wi-Fi Planet Staff](#) / January 30, 2007

The new Bio-NetGuard from [Shimon Systems](#) is billed as biometric security specifically for Wi-Fi networks, which authenticates a user, not just the computer they're logging in with. The hardware connects directly to access points from Netgear, Linksys, D-Link and Bountiful right now, or to a router serving multiple APs. End users use the biometric fingerprint scanners on their computer, or use a two-factor authentication with fingerprint and password. The Bio-NetGuard will support 5 to 250 users. It requires Windows 2000/XP/Vista.
